

ABSTRACT

A hair styling device includes two clasp plates each having a barrel provided thereon, and a spring member received and shielded and protected within the barrels and having two ends coupled to the
5 barrels to recover and bias the clasp plates toward each other when the clasp plates are released. Each of the barrels includes a positioning pin to anchor the ends of the spring member, and to allow the spring member to be twisted when the barrels are rotated relative to each other. Each of the barrels includes an inclined
10 surface slidably engaged with each other to move the barrels toward and away from each other when the barrels are rotated relative to each other.
